21 NEW CANNABINOIDS DISCOVERED

THE DYNAMIC V8 from Dynamic Air Quality Solutions mounts in central HVAC systems or stand-alone units to provide MERV15 air cleaning performance and removal of harmful airborne contaminants including bacteria, molds and powdery mildew for a consistent growing environment and optimized plant health. The Dynamic V8 sets the standard in air cleaning - outperforming anything on the market in terms of contaminant control, maintenance, and cost of ownership. Low static pressure resistance requires 2/3 less fan energy than conventional MERV14 filters and a high dust-holding capacity means long filter change-out intervals - measured in YEARS, plus odor and VOC reduction - without ozone.

ACTIVATED CARBON MATRIX (ACM) systems from Dynamic Air Quality Solutions remove powerful odors from exhaust air and offer many advantages over conventional carbon pellet systems including: 1) half the static pressure resistance for blower fan energy savings, 2) fast and effective odor removal at higher velocities, 3) effective in damp conditions, and 4) a fraction of the size and weight for a smaller footprint and easy handling. ACM systems are used in applications ranging from odor control in waste treatment facilities to controlling targeted gas phase contaminants in museums and art galleries.
